

# Chapter 1 Lesson 1

## Factors and Multiples

Product – answer to multiplication problem

factors

factor

$$7 \times 8 = 56$$
$$56 \div 8 = 7$$

Prime number – a number that has only 2 factors (itself and 1)

Examples:  $7 \rightarrow 7 \times 1 = 7$

$5 \rightarrow 5 \times 1 = 5$

Composite number – a number that has more than 2 factors

Examples:

$$\begin{array}{r} 10 \\ \hline 1 \times 10 \\ 2 \times 5 \end{array}$$

$$\begin{array}{r} 12 \\ \hline 1 \times 12 \\ 2 \times 6 \\ 3 \times 4 \end{array}$$

# Prime Factorization Examples

$$2 \times 2 \times 2 \times 2 \times 3 = 48$$

$$2^4 \times 3 = 48$$

Greatest Common Factor (GCF) – largest of the common factors

Example:

36  
 $1 \times 36$   
 $2 \times 18$   
 $3 \times 12$   
 $4 \times 9$   
 $6 \times 6$

24  
 $1 \times 24$   
 $2 \times 12$   
 $3 \times 8$   
 $4 \times 6$

GCF Use Prime Factorization

\* Circle when both sides have the number

$$2 \times 2 \times 3 = 12$$

$$\text{GCF} = 12$$

Least Common Multiple (LCM) – smallest number that is common between a list of multiples

Examples:

12  
 $12 \times 1 = 12$   
 $12 \times 2 = 24$   
 $12 \times 3 = 36$   
 $12 \times 4 = 48$   
 $12 \times 5 = 60$

18  
 $18 \times 1 = 18$   
 $18 \times 2 = 36$   
 $18 \times 3 = 54$   
 LCM = 36

LCM Use Prime Factorization:

\* Find all common numbers + circle them multiply left overs too!  
 $2 \times 3 \times 2 \times 3 = 36$

Cake / Ladder Method Examples:

GCF = left side only  
 LCM = makes L  
~~simplified~~

$$GCF = 6 = 2 \times 3$$

$$LCM = 36 = 2 \cdot 3 \cdot 2 \cdot 3$$

$$\begin{array}{r} 2 \\ 49 \\ \times 3 \\ \hline 147 \end{array}$$

Examples continued:

GCF =  $5 \cdot 2 = 10$   
 LCM =  $5 \cdot 2 \cdot 3 \cdot 4 = 120$

$$\begin{array}{r|rr} 5 & 30 & 40 \\ \hline & 6 & 8 \\ 2 & \underline{6} & 8 \\ & 3 & 4 \end{array}$$

$$\begin{array}{r|rr} 7 & 49 & 21 \\ \hline & 7 & 3 \end{array}$$

GCF = 7  
 LCM =  $7 \cdot 7 \cdot 3 = 147$

$2 \mid 28 \ 42$   
 $7 \mid 14 \ 21$   
 $2 \ 3$   
 LCM =  $2 \cdot 7 \cdot 2 \cdot 3 = 84$   
 GCF =  $2 \cdot 7 = 14$

### How to Do Prime Factorization Using a Factor Tree

Step 1 – Start with a composite number.

48

Step 2 – Write down a multiplication problem that equals this number or any pair of factors of this number.

$$6 \times 8 = 48$$

### How to Do Prime Factorization Using a Factor Tree

Step 3 – Find factors of these factors.

$$\begin{array}{c}
 6 \times 8 = 48 \\
 \swarrow \quad \downarrow \quad \searrow \\
 2 \times 3 \times 2 \times 4 = 48
 \end{array}$$

### How to Do Prime Factorization Using a Factor Tree

Step 4 – Find factors of these numbers until all factors are prime numbers.

$$\begin{array}{c}
 6 \times 8 = 48 \\
 \swarrow \quad \downarrow \quad \searrow \\
 2 \times 3 \times 2 \times 4 = 48 \\
 \swarrow \quad \downarrow \quad \searrow \\
 2 \times 3 \times 2 \times 2 \times 2 = 48
 \end{array}$$

### How to Do Prime Factorization Using a Factor Tree

Step 5 – Write the numbers from least to greatest.

$$\begin{array}{c}
 6 \times 8 = 48 \\
 2 \times 3 \times 2 \times 2 \times 2 = 48 \\
 2 \times 2 \times 2 \times 2 \times 3 = 48
 \end{array}$$

### How to Do Prime Factorization Using a Factor Tree

Step 6 – Count how many numbers are the same and write exponents for them.

$$\begin{array}{c}
 6 \times 8 = 48 \\
 2 \times 3 \times 2 \times 2 \times 2 = 48 \\
 \textcircled{2} \times \textcircled{2} \times \textcircled{2} \times \textcircled{2} \times 3 = 48 \\
 2^4 \times 3 = 48
 \end{array}$$
